

To write numbers more mathematically after \times or \div by 10 or 100 or 1000 use these two rules

(i) Look at the digits **before** (to the left of) the decimal point: Are there any 1 to 9 digits?

Yes: Cross out any 0 digits before (to the left of) the first (most left) 1 to 9 digit

$$0.003 \rightarrow \cancel{0.00}3$$

No: Keep **one** 0 and cross out the rest OR write 0 if there is no 0

$$0.003 \rightarrow \cancel{0.0}03 \qquad \overset{\curvearrowright}{4}5 \rightarrow 0.\overset{\curvearrowright}{4}5$$

(ii) Look at the digits **after** (to the right of) the decimal point: Are there any 1 to 9 digits?

Yes: Cross out any 0 digits after (to the right of) the last (most right) 1 to 9 digit

$$6.070 \rightarrow 6.07\cancel{0}$$

No: Cross out the decimal point and any 0 digits

$$80.00 \rightarrow 80\cancel{.00}$$

To write numbers more mathematically after \times or \div by 10 or 100 or 1000 use these two rules
